

"PLASTISET" EPOXY PRIMER

'PLSTISET' Epoxy primer has been formulated by us especially for carrying out high class work in the repair of old buildings and also for surface application in new constructions. 'PLASTISET' Epoxy Primer is commonly used, both on steel reinforcement (old or new), prior to concreting or repair of broken columns, beams, slabs etc., and also on broken masonry for good adhesion to fresh concrete or mortar.

The application of 'PLASTISET' to reinforcement protects it permanently from corrosion, which would cause expansion and splitting of vital structural members. PLASTISET' is also applied on broken or spalled surfaces of concrete or mortar, prior to applying fresh repair mortar in order to obtain excellent bonding. It is supplied in two components of brushing consistency, consisting of 2 parts of Resin and 1 part of Hardener. This volumetric system of measurement makes PLASTISET, very convenient for use at site by even unskilled or semi-skilled workers.

OTHER USES

1. Effective waterproofing of Bathroom slabs and walls to avoid seepage into Lower floors.
2. For treating "Efflorescence" (bubbling of paint or plaster on internal walls due to salts in the sand used in the original Mortar).
3. For internal waterproofing of "water tanks" please refer to our product leaflet "PLASTISET WT" which is Odourless and Non-Toxic.
